Risk Controlled Mechanism

A 6% risk control overlay/volatility target is applied on each parent sub-index. The returns of each parent sub-index are used for volatility estimation. The volatility estimation approach considers both the short-term and the long-term volatility trends of the respective parent sub-index. Volatility is calculated as the maximum of two volatility estimates: the short-term realized volatility estimate, calculated over a short period of 20 days, and the long-term realized volatility estimate, calculated over a long period of 60 days. The volatility estimation approach uses equally weighted daily price returns of the parent sub-index for both periods.

Index Leverage

The index leverage is calculated daily as the ratio of the specific 6% risk level and the parent sub-index volatility subject to a maximum leverage of 100%. If the MSCI parent sub-index volatility is higher than 6% then the weight of the MSCI parent sub-index will be less than 100% while the weight of the cash component will be 100% minus the weight of the parent sub-index. The index leverage applicable on an effective date is determined using the parent sub-index volatility estimated one trading day before the effective date.

Interest Rate Deduction

From each of the risk controlled sub-indices, a blended 2-month Libor and 3-month Libor interest rate is deducted daily.

Momentum Leverage

A corresponding momentum overlay weight/signal is assigned to the respective risk-controlled regime sub-indices to get the final regime sub-indices. The leverage weight can vary from 30% to a max weight of 130%. The momentum Leverage weight applicable on an effective date is determined based on the average Leverage Weight over 5 previous trading days starting one trading day before effective date.

Monthly Index reviews

The MSCI World Business Cycle Select Factor Index is reviewed on a monthly basis.

Staggered Rebalance

The monthly Index rebalance is staggered over a period of 3 days starting on the last trading day of each month. Three versions of the Index are calculated, each having their rebalancing dates as last but one trading day of the month, last trading day of the month and 1st trading day of subsequent month with their respective effective dates as the last trading day of the month, 1st trading day of subsequent month and to 2nd trading day of subsequent month. These indexes are then equal weighted to arrive at the final index, which rebalances to equal weights.

New additions to the Parent Index

A new security added to the parent index (such as IPO and other early inclusions) will not be added to the index.

Spin-Offs

All securities created as a result of the spin-off of an existing Index constituent will be added to the Index at the time of event implementation. Reevaluation for continued inclusion in the Index will occur at the subsequent index review.

Merger/Acquisition

For mergers and acquisitions, the acquirer's post event weight will account for the proportionate amount of shares involved in deal consideration, while cash proceeds will be invested across the index. If an existing index constituent is acquired by a non-Index constituent, the existing

	<p>constituent will be deleted from the index and the acquiring non-constituent will not be added to the index.</p> <p><u>Changes in security characteristics</u></p> <p>A security will be kept in the Index if there are changes in its characteristics (country, sector, size segment, etc.) Reevaluation for inclusion in the index will occur at the subsequent index review.</p> <p>The MSCI corporate events methodology book is available at: https://www.msci.com/index-methodology</p> <p>The index sponsor has provided Absa Bank Ltd authority to use the index.
